Preface to the First Edition xiv

Preface to the Third Edition xvii

Acknowledgements xix

Chapter 1. Dimensions, Units, and Conversion Factors 1

1.1 The SI System of Units 1

1.1.1 Derived Units 2

1.1.2 Units Outside the SI 3

1.1.3 Comments on Some Quantities and Their Units 4

1.2 The American Engineering System (AES) of Units 4

1.3 Conversion of Units 6

1.3.1 Conversion Factor Tables 6

1.3.2 The Dimension Table 7

1.3.3 Conversion Equations — Temperature and Pressure 8

1.4 Unit Conversions Using the U-Converter Program 11

1.5 Amount of Substance — the Mole Unit 11

1.6 Density and Concentration 13

1.6.1 Density 13

1.6.2 Composition and Concentration 16

1.6.3 Composition of Gases 18

1.7 Electrical Units 20

1.8 Calculation Guidelines 21

1.9 Summary 22

References and Further Reading 23

Exercises 23

Chapter 2. Thermophysical and Related Properties of Materials 26

2.1 State of a System and Properties of a Substance 26

2.2 The Gibbs Phase Rule 27

2.2.1 Consequences of the Phase Rule for Non-Reactive and Reactive Systems 27

2.2.2 Application of the Phase Rule to One-Phase Non-Reactive Systems 28

2.2.3 Application of the Phase Rule to Multi-Phase Non-Reactive Systems 28

2.2.4 Application of the Phase Rule to Reactive Systems 29

2.3 The Gas Phase 30

2.3.1 The Ideal Gas Law 30

2.3.2 Non-Ideal Gas Behavior 32

2.4 Condensed Phases 34

2.5 Vapor-Liquid Equilibrium (VLE) 35

2.5.1 Mixtures of Condensable and Non-Condensable Gases 38

2.5.2 Software for Making Dew Point and Humidity Calculations 39

2.6 Effect of Pressure on Phase Transformation Temperatures 42

2.7 Steam and Air Property Calculators 44

2.8 Properties of Solutions 44

2.8.1 Ideal Solutions — Raoult's Law 44

2.8.2 Non-Ideal Solutions — Activity Coefficients 46

2.8.3	Solutions of Gases in Condensed Phases	47
2.8.4	The Solubility Limit	48
2.8.5	The Solubility of Ionic Species in Water; the Solubility Product	49
2.9	Summary	50
	References and Further Reading	51
	Exercises	52

Chapter 3. Statistical Concepts Applied to Measurement and Sampling 54

3.1	Basic Statistical Concepts and Descriptive Tools	55
3.1.1	Histograms and Frequency Distributions	56
3.1.2	Mean, Standard Deviation, and Variance	59
3.1.3	Median, Percentile and Quantile	60
3.2	Distributions of Random Variables	62
3.2.1	The Uniform Distribution	62
3.2.2	The Normal Distribution	70
3.3	Basic Applications of Inferential Statistics to Measurement	75
3.3.1	Sampling Distributions of the Mean and the Central Limit Theorem	78
3.3.2	Confidence Intervals	82
3.3.3	Treatment of Errors	86
3.3.4	Error Propagation	92
3.4	Curve Fitting	95
3.4.1	Simple Linear Regression and Excel's Trendline Tool	96
3.4.2	Using Solver to Develop Single-Variable Regression Models	101
3.4.3	Multiple Linear and Non-linear Regression	102
3.4.4	Using Solver and Excel's SSD Tool to Find Equation Coefficients	105
3.4.5	Choosing Among Models	106
3.4.6	Polynomial vs. Rational Function Models	116
3.4.7	Outliers	117
3.4.8	Warnings	119
3.5	Experimental Design	119
3.5.1	Factorial Design	120
3.5.2	Fractional Factorial Design	130
3.6	Summary	137
	References and Further Reading	137
	Exercises	138

Chapter 4. Fundamentals of Material Balances with Applications to Non-Reacting Systems 144

4.1	System Characteristics	144
4.2	Process Classifications	145
4.3	Flowsheets	146
4.4	The General Balance Equation	150
4.5	Material Balances on Simple Non-Reactive Systems	151
4.6	Strategy for Making Material Balance Calculations	154
4.6.1	Guidelines for Setting up a Materials Balance	155
4.6.2	Guidelines for Resolving a Set of Equations	156
4.6.3	Objectives of a Material Balance	157
4.7	Degree-of-Freedom Analysis	158
4.7.1	DOF Concepts	159
4.7.2	DOF Calculation Strategy for a Single Non-Reactive Device	160
4.7.3	A Washing Process Having Zero Degrees of Freedom	162

4.7.4	A Washing Process Having a $\text{DOF} = +1$	168
4.7.5	A Leaching Process Having a $\text{DOF} = -1$	171
4.8	Using Excel-based Computational Tools to Solve Equations	174
4.8.1	Goal Seek and Solver as Computational Aids	174
4.8.2	Software for Conversion of Stream Units: MMV-C	178
4.9	Balances on Systems with Multiple Devices	179
4.10	Extension of Excel's Computational Tools for Repetitive Solving	194
4.10.1	SuperGS	194
4.10.2	SuperSolver	196
4.11	Special Multiple-Device Configurations I — Recycle and Bypass	197
4.12	Special Multiple-Device Configurations II — Counter-Current Flow	205
4.13	Using FlowBal for Material Balance Calculations	216
4.13.1	FlowBal Example #1: Mixer/Splitter	217
4.13.2	FlowBal Example #2: Evaporation/Condensation Process	219
4.13.3	FlowBal Example #3: Systems with Multi-Phase Streams	221
4.14	Continuous-Mixing Devices	223
4.14.1	Steady-State Processes	223
4.14.2	Unsteady-State Systems	226
4.14.3	Inert Gas Flushing	229
4.15	Graphical Representation of Material Balances	232
4.16	Measures of Performance	232
4.17	Controllers	234
4.18	Summary	239
	References and Further Reading	240
	Exercises	241

Chapter 5. Stoichiometry and the Chemical Equation 248

5.1	Atomic and Molecular Mass	248
5.2	Composition of Compounds and the Gravimetric Factor	249
5.3	Writing and Balancing Chemical Equations	251
5.3.1	Chemical Reaction Concepts	252
5.3.2	Writing and Balancing Chemical Reactions for Simple Processes	253
5.4	Calculations Involving Excess and Limiting Reactants	256
5.5	Progress of a Reaction	258
5.5.1	Extent of Species Reaction and Rate of Reaction Terminology	258
5.5.2	Chemical Reaction Kinetics	259
5.5.3	Reaction Progress and K_{eq}	263
5.5.4	K_{eq} Values from FREED	264
5.5.5	Guidelines for Using K_{eq} to Determine Maximum Reaction Extent	265
5.5.6	Application of Equilibrium Limitations for Gas-Condensed Phase Reactions	266
5.5.7	Application of Equilibrium Limitations to Gas-Phase Reactions	268
5.6	Practical Indicators of the Progress of Reactions and Processes	269
5.7	Parallel, Sequential and Mixed Reactions	273
5.8	Independence of Chemical Reactions	274
5.9	Practical Examples of Reaction Writing and Stoichiometry	274
5.9.1	Calculations in Gas-Condensed Phase Processes	275
5.9.2	Calculations in Gas-Phase Processes	277
5.10	Use of Chemical Reactions in FlowBal	279
5.10.1	FlowBal's Extent of Reaction Tool	280

5.10.2 FlowBal's Insert Equation Tool	282
5.11 Balancing Aqueous (Ionic) Reactions	283
5.12 Summary	286
References and Further Reading	288
Exercises	288

Chapter 6. Reactive Material Balances 294

6.1 The General Material Balance Procedure for a Reactive System	294
6.1.1 Independent Chemical Reactions, Independent Species, and Independent Elements	295
6.1.2 Molecular Species Material Balance Method	296
6.1.3 Atomic Species Method	300
6.1.4 Atomic and Molecular Species Balance Examples	302
6.2 The Use of Excel-based Computational Tools in Reactive System Balances	306
6.2.1 Application of SuperSolver	306
6.2.2 Reactive System Material Balances Using FlowBal	309
6.3 Combustion Material Balances	321
6.3.1 Material Balance for the Combustion of a Gaseous Fuel	322
6.3.2 Combustion of Liquid Fuels	327
6.3.3 Combustion of Solid Fuels	327
6.3.4 Use of Feed-Forward and Stack Gas Analysis for Combustion Control	329
6.3.5 Use of FlowBal for Combustion Calculations	333
6.3.6 Trace Combustion Products	335
6.4 The Production of a Reducing Gas	340
6.5 Gas-Solid Oxidation-Reduction Processes	345
6.5.1 Oxidation-Reduction During Calcination	345
6.5.2 The Reduction of Iron Ore Concentrate	348
6.5.3 The Chemistry of Fluidized Bed Reduction of Iron Ore by Hydrogen	349
6.5.4 Excel Simulation of the Fluidized Bed Reduction of Hematite	351
6.5.5 FlowBal Simulation of the Fluidized Bed Reduction of Hematite	355
6.5.6 Shaft Furnace Reduction of Iron Ore Concentrate	359
6.5.7 The Roasting of a Sulfide Concentrate	366
6.6 The Production of Gases with Controlled Oxygen and Carbon Potential	370
6.7 Processes Controlled by Chemical Reaction Kinetics	371
6.8 The Reconciliation of an Existing Materials Balance	372
6.9 The Use of Distribution Coefficients in Material Balance Calculations	377
6.9.1 Use of Tabulated Distribution Coefficients	377
6.9.2 Thermodynamic Databases as a Source of Distribution Coefficient Data	381
6.10 Time-Varying Processes	384
6.11 Systems Containing Aqueous Electrolytes	389
6.11.1 The Stability of Ions	390
6.11.2 Aqueous Processes	392
6.11.3 The Solubility of Ionizable Gases in Water	398
6.12 Summary	402
References and Further Reading	404
Exercises	405

Chapter 7. Energy and the First Law of Thermodynamics 410

7.1 Principles and Definitions	410
7.2 General Statement of the First Law of Thermodynamics	413

7.3	First Law for an Open System	415
7.4	Enthalpy, Heat Capacity, and Heat Content	416
7.5	Enthalpy Change of Phase Transformations	418
7.6	Enthalpy Change of Chemical Reactions	420
7.7	Thermodynamic Databases for Pure Substances	421
7.8	Effect of Temperature on Heat of Reaction	426
7.8.1	Application of Kirchhoff's Equation to Chemical Reactions	426
7.8.2	Heat of Transformation for Non-Standard and Non-Physical States	428
7.9	The Properties of Steam and Compressed Air	431
7.9.1	Properties of Steam	431
7.9.2	Properties of Compressed Air	432
7.9.3	Temperature Change for Free Expansion of a Gas	433
7.9.4	Cooling by Steam Venting	435
7.9.5	Enthalpy of Psychrometry	436
7.10	The Use of FREED in Making Heat Balances	437
7.11	Heat of Solution	441
7.11.1	Formation of Non-ideal Metallic Solutions	441
7.11.2	Polymeric Solutions	442
7.11.3	Aqueous Solutions	444
7.12	Summary	445
	References and Further Reading	446
	Exercises	447

Chapter 8. Enthalpy Balances in Non-Reactive Systems 450

8.1	Combined Material and Heat (System) Balances	450
8.2	Heat Balances for Adiabatic Processes	458
8.3	Psychrometric Calculations	462
8.4	Energy Efficiency	468
8.5	Recovery and Recycling of Heat	469
8.5.1	Heat Exchange Between Fluids	469
8.5.2	Heat Exchange between Solids and Fluids	474
8.5.3	Application of Heat Recovery Techniques to Aluminum Melting	474
8.5.4	Heat Exchange Accompanied by Material Transfer	478
8.6	Multiple-Device System Balances	483
8.7	Use of FlowBal for System Balances	488
8.8	Heat Balances Involving Solution Phases	494
8.9	Enthalpy Change During Dissolution of an Electrolyte	496
8.10	Graphical Representation of a Heat Balance	499
8.11	Summary	500
	References and Further Reading	501
	Exercises	5020

Chapter 9. System Balances on Reactive Processes 505

9.1	Thermal Constraints on a Material Balance	505
9.1.1	Uncoupled System Balances	506
9.1.2	Strategy for Coupled System Balance	508
9.2	Combustion of Fuels	511
9.2.1	Heat of Combustion Calculations	512

9.2.2	Use of Wobbe Index for Combustion Burner Control	514
9.2.3	Combustion of Fuels of Uncertain Molecular Composition	516
9.3	Adiabatic Processes	517
9.3.1	System Balances Involving Combustion Reactions	518
9.3.2	ART for Condensed-Phase Reaction Processes	531
9.4	System Balances Using FlowBal	533
9.5	Quality of Heat and Thermal Efficiency	542
9.6	System Balances with Heat Exchangers	548
9.7	Aqueous Processes	565
9.8	Electrolytic Processes	571
9.8.1	Energy Requirement for Electrorefining	571
9.8.2	Energy Requirement for Electrowinning	572
9.9	Summary	573
	References and Further Reading	574
	Exercises	574

Chapter 10. Case Studies 577

10.1	Material Balance for an H-Iron Reduction Process with Gas Tempering and Recycle	577
10.2	Mass and Heat Balance Simulation for the Use of DRI in EAF Steelmaking	581
10.3	Natural Gas Combustion Control and the Wobbe Index	588
10.3.1	The Stoichiometry of NG Combustion with Excess Air	588
10.3.2	The Wobbe Index as a Natural Gas Combustion Control Parameter	591
10.4	Reduction of Hematite to Magnetite	592
10.4.1	Preliminary Calculations — Single Reactor	593
10.4.2	Simulation of Hematite Reduction by a Multi-Stage Process	595
10.5	Conversion of Quartz to Cristobalite in a Fluidized Bed	598
10.5.1	Process Characteristics	598
10.5.2	Device Sizing and Heat Loss Calculation	598
10.5.3	Material and Heat Balance Calculations	599
	Exercise	600

Appendix. Computational Tools for Making Material and Heat Balance Calculations 601

A.1	U-Converter	601
A.2	Thermophysical Properties of Steam and Air	602
A.3	Stream Units Conversion Calculator (MMV-C)	602
A.4	Extension of Excel Tools for Repeat Calculation	603
A.5	Thermodynamic Database Programs	604
A.6	Flowsheet Simulation and System Balancing	604
